This site is no longer used. We use https://gitlab.com/groups/tikiwiki/-/merge_requests instead.

This is the page used but the Quality Team to coordinate work on http://code.tiki.org

Table of contents

- Urgent
- To do
- Questions
- Nice to have
- Later

Urgent

- Configure code.tiki.org according to the policies set by the Quality Team (Looking for a leader)
  - The voting uses PluginProposal and in Tiki10, there was a useful feature: Adding the ability to set custom weights to groups in the proposal plugin, which affects the stored attributes
- Start voting on backlog of commits (Nelson & all)

To do

- Use the Rating Language to make dashboards
  - A way to know until which commit everything is approved.
    - So people that want stability can use this and always have approved commits
    - Would be nice to have the date indicated, and a counter to know how many days delay we have

Questions

- Do we need different dashboard of 6x vs 9x?
  - Should we have a category for 6x vs 9x commits?
- Can we have a flag/commit/category/status to indicate that this commit needs attention? Ex.: it was done in the stable branch but not merged to trunk

Nice to have

- A way for people to report "This commit caused a regression, which needs to be fixed quickly" and that we have a dashboard of these regressions
- Ideally, we'd have a post-commit hook that modifies the message to cvs-svn mailing list to add the URL to the code review tool. URL pattern will be something like https://code.tiki.org/r52365
Later

- Once everything is running smoothly, make a profile with the recipe.
