# ApplicationMenuDoc

User Documentation

The application menu is the first menu at the left sidebar.

***Insert graphic***

The menu is divided in sections here (Wiki, Galleries and CMS),it can have many sections if you enable the different Tiki features from the Tiki admin screen. In order to use the menu you should use the + and - links to expand and collapse sections, if you click + in the Wiki section this is what happens. If you have cookies enabled the menu will remember it's state as you navigate the application if not the menu will present all the sections closed each time you load a new page. To enable/disable features click the Admin link once logged as admin. The main admin panel will appear where a LOT of things can be configured. Read about the admin panel later in this manual to learn what you can do from there.

***Insert graphic***

Now you can see the different links for the Wiki, use - if you want to close this section of the menu.

Clicking the Menu title will collapse/expand the whole menu if you want. Each section name links to the section home. Wiki will take you to the Wiki page named HomePage, Galleries will take you to the list of file galleries, CMS will take you to the articles home page and Blogs will take you to the list of blogs. Etc. The home link at the first line of the menu takes you to one of the many different sections that can be used as a HomePage, you can select which section will be used as the HomePage from the admin screen, you can even set up any URL as home from the admin screen.

Tiki is now installed and ready to be configured and used, Jump to administration functions in order to learn how to configure users, groups, permissions, modules and features if you want.

# Building your own menus

The Tiki application menu is automatically populated with the features that you have enabled and where the use has the right permission to access. But in some cases you don t want to use this menu because you don t like it or you want options in a different order, or something. Tiki incorporates a menu-builder tool where admins can create menus that can be used in Tiki for whatever you want, links to special sections of the site, links to external sites, any link can be used and there re three different menu-types that can be used. Read about this tool in the admin section of this manual: Menu builder.

> Menus and some Opera versions:
>
> It's been reported that menus don't work with some Opera versions, this is 100% an Opera bug and you should report it to the Opera team. If you do want to use that browser version to access tiki you will need to build a menu for your site using the menu-builder. Use a static menu type and it will work with Opera.

Try it out

please link to the live Feature on tiki.org

## Notes

This page is for the latest released stable version or release candidate(not stuff in CVS).
