

DrawToggg

Get the drawing stuff working

Should be OK for 1.8, 1.9 single and multitiki...

but not yet on tw:o, wait next site update to try

PHP 4.2.2 users, the change was not enough ! but OK now see below

Anyway, if you can give it try by applying these changes home, it will be great !

Particularly, if you run multitiki with a single documentRoot, your opinion is welcome.

[marclaporte](#) reports the following problem on tw.o: I can edit image but when I save, the old pic is still there. I need to refresh (CTRL-f5) the page to get pic. And now I see it but when I try to edit, I don't have the latest version of the image (!)

[toggg](#) Marc: I need to refresh too as my browser is caching, thus I have no problem to edit drawings and back (as you can see here). Could it be related to your browser ?

Caution that need to be enabled for your group And the drawings enabled in Admin Features!  
tikiwiki version 1.8.x (and prior?)

You need to modify 4 lines in the script jhot.php as follows:

- lines 22 to 24:

from:

```
22<
```

```
23< $absolute_name = str_replace("img/wiki/$tikidomain", "", $name);
```

```
24< $absolute_name = str_replace('.gif', "", $absolute_name);
```

to:

```
22> $path = 'img/wiki/'.($tikidomain != '/' ? $tikidomain : '');
```

```
23> $name = str_replace($path, "", $name);
```

```
24> $absolute_name = str_replace('.gif', "", $name);
```

- lines 43 & 44:

from:

```
43< $fw = fopen("img/wiki/$tikidomain$hash", "wb");
```

```
44< $fw2 = fopen($name, "wb");
```

to:

```
43> $fw = fopen($path.$hash, "wb");
```

```
44> $fw2 = fopen($path.$name, "wb");
```

tikiwiki from version 1.9

Should be ok for 1.9 cvs (thanks tom 

You can do it home:

- In jhot.php

insert between lines 48 and 49 (not done in cvs)

```
47> if ($tikidomain) {
```

```
48> $hash = "$tikidomain/$hash";
```

```
>> $name = "$tikidomain/$name";
```

```
49> }
```

and change (done in cvs)

```
51> $fw2 = fopen($name, "wb");
```

into

```
51> $fw2 = fopen("img/wiki/$name", "wb");
```

- In tiki-editdrawing.php

just withdraw the 2 points before \$name line 37 and 39  
\$tikidomain/\$name and not \$tikidomain/.\$name

That's all.

Now comes the most difficult: make beautiful drawings 

Tikily yours,

--

bertrand Gugger (toggg) Wanting to draw

marclaporte: latest changes are working on my multi-tiki. However, it opens a new java applet at each edit.

toggg: linux user: Konqueror better controls java than Mozilla !

More help on this problem: [JgraphPadDoc](#)
