

Groupware Interfaces

Interface Favorites

Here is a snip from Marc Page. I just cut and pasted this as I seem to have been down the same path and wish to add comments on why they not implemented within the scopes I required

<http://www.moregroupware.org/>

Nice and simple GUI and has nice company relationships and partner modules, also has a really cool looking web mail app.

- calendar is fantastic and I think we could integrate this as its smartified already
- moregroupware style sheet would be nice
- needs graphical tabs to make it more intuitive and copy an exe
- contacts are not automatically created as users
- users could login once I created them. yawn.. and it was okish

- would love this functionality in tikiwiki and would think imho that this is the one to integrate with - what moretikiwiki ;-)

<http://www.phprojekt.com/>

provides a wide range of functions, none of which really excel, although the calendar module looks pretty neat.

- calendar is neat - this is not smarty

<http://www.phpgroupware.org/>

Latest release includes some theme and CMS support, generally this has a good contacts and project management capability we could add these to tiki

- too many modules and a childish looking interface.. Come on this is business

<http://www.dotproject.net/>

has a nice windows feel to it, but little substance

- uses php to create calendar popup - ie calls back to server
- love the outlook feel because users can relate to that. Samiliarity
- Fantastic gnatt charts except they could be in iframes
- if this could have an outlook look alike calendar with [JsCalendar](#) ie 2x6 nomths view on panel

Non Starters

<http://www.tutos.org/homepage/index.html>

if you figure out how you are supposed to use this system please let me know, it took me few hours to figure out how to add a user! Just call me Dumbo J

- Agreed u dimwit

<http://dcl.sourceforge.net/> Double Choco Latte is more of a tracking tool for project/product not sure how this fits? Nice calendar popup. Appears to be a port of phpgroupware.

<http://www.phpcollab.com/phpbb/index.php> is a project management tool, primarily aimed at software nice gant chart

<http://www.relata.org/> (next version won't be GPL) simple GUI, but I would never pay for this so good luck on what every they are going to do.

<http://www.anteil.com/> This one looks pretty good.

<http://www.customer-touch.com/> Demo - Ok but really a bug tracking system and nothing more, bugzilla and a number of other solution are more practical

<http://www.guanxicrm.com/> clone of moregroupware, which is unicode compliant? They are also building an xoops module for this which may be good! As xoops was my second choice after tiki as the foundation.

<http://e-crm.sourceforge.net/> could not connect to demo!

<http://crm-ctt.sourceforge.net/> nothing more than a tracker, but has a very clean interface and uses a lot of mouse over stuff! Need to install and play with it!

<http://issue-tracker.sourceforge.net/> another tracker, but has escalation support and instant email notifications. Although no demo available, must install and play!

<http://www.leads4web.de> INSTALL FIRST - could not read German, but screen shot looked interesting!

<http://www.limerence.net/> An invoicing piece of software

<http://openrcm.sourceforge.net/> last update was in May 2002, which means its fantastic or crap? Have not played with it.

<http://assistant.sourceforge.net/> INSTALL - at 250k this has got to be worth installing!

<http://sourceforge.net/projects/egs/>

The interface we want
