

IconReview

Tiki has several duplicate icons, and icons that may be more widely recognized than others. This is a place to document Tiki's icons, where individual icons are being used in Tiki, and suggestions for new & more widely recognized icons for Tiki. Please add your comments using bullets below the icon you wish to comment on. 

My ideas:

- We should really get rid of the all icons copied from M\$ WinXP - Why not use KDE's Crystal or [Nuvola](#) icons ? They are ones of the most complete and consistent iconsets and both are LGPL as so as we are.

Shortcut Icon

 favicon.ico - /

Comments:

- [SEWilco](#) - The browser shortcut icon is not yet supported by Tiki.
 - Telling browsers to use shortcut icons is trivial: see WikiShortcutIcon.
 - The **/favicon.ico** location is an old default. Some browsers can be told the icon location in a page's <HEAD>.
 - There should be support for different shortcut icons for each (virtual) site.
 - Different icons may be needed for various sections or pages, so multiple icons should be expected.
