Open Hub

Here are the stats: https://www.openhub.net/p/tikiwiki

About the stats:

- 2023-05 saw a surge of commits thanks to Using GlitchTip as part of the Tiki development process with hundreds of small commits to add support for PHP8 and remove (mostly harmless) error messages.
- In 2020-06, we see a steep reduction of monthly contributors. This is of course caused by Covid-19. In October 2021, the situation is back to normal.
- In 2019, the Tiki community switched over from SVN to Git, and this leads to more work/output per commit, because multiple commits are squashed into one. So the real activity level is much higher than it looks on the chart.
- 2018-09 and 2018-10 were busy with preparation of Tiki19, mainly the upgrade to Bootstrap 4.
- 2007-11 to 2008-02: The number of contributors and commits drops to nearly 0, which doesn't fit the trend. It also doesn't seem logical given that in 2008-08, Tiki 2.0 was released in which “80 people contributed 6894 commits”. I (Marc) have a vague recollection that we had an issue with the source control system, perhaps the migration from CVS to SVN.

Tiki vs WordPress vs Drupal
https://www.openhub.net/p/_compare?project_0=Drupal+%28core%29&project_1=WordPress&project_2=Tiki+Wiki+CMS+Groupware

Top committers of all time
https://www.openhub.net/p/tikiwiki/contributors

Top committers of the last 12 months
https://www.openhub.net/p/tikiwiki/contributors?sort=twelve_month_commits

Top committers of all time, that are active in last 12 months
https://www.openhub.net/p/tikiwiki/contributors?sort=commits&time_span=12+months

Top committers of all time, that are active in last 30 days
https://www.openhub.net/p/tikiwiki/contributors?sort=commits&time_span=30+days

Tiki dependencies
We have a specific entry:
https://www.openhub.net/p/tiki-dependencies

Analysis

- In the 2013-2015 period vs 2017 and after
  - The number of commits is very high
  - The fluctuations are intense from month to month, which is surprising given it’s aggregate data for over 100 projects.
Potential explanation: Many projects used today by Tiki were born in 2011-2013 and there was a lot of initial activity and things stabilized because many projects became more established and because of the move to Git (more work/output per commit, because multiple commits are squashed into one). Also, some projects were started on GitHub.

Comparison:

Notes

- For charts, there are 2 possible values for time_span: 30+days and 12+months.
