

PatchParseFromZaafi

Hi TIKI list!

(hope TIKI developers here too)

I found a lists parser code in TIKI too buggy. I'm (we are at office of small software company) use tiki starting from 1.2 version but bugs in lists still exists in 1.6.1 — so I rewrite list parser almost from scratch... and would like to share it with TIKI developers... (so they can include it into cvs version 😊)

## New features

---

It is now possible to append paragraphs to list item. Wiki source example:

- item1 1st paragraph  
item1 2nd paragraph
- item2

as you can notice to append paragraph it should start with '+' symbol... one or more depends on list depth:

- item level1
  - item level2  
continue item level2  
another paragraph for item level2
    - item level3  
continue item level3
- back to level 1  
continue level 1 item

Note that anytime you can return to upper level (one of) and continue to append paragraphs or new items. It works even with mixed lists without break numbering items:

1. level 1-1
  - level 2-1
  - level 2-2  
continue level 1-1
2. level 1-2
  - level 2
    - 1. level 3-1  
continue level2

## Bugs gone

---

1. Opened ol & ul remains if list item was last line on wiki page
2. Can mix ul & ol lists with different levels without ends previous list...

so lists of different types can be nested wich is make lists more usefull 😊

## Optimizatoins

---

1. Code become much more shorter 😊

PS

---

It will really help me if somebody from TIKI developers respond on this message...

Actually I'm C++ programmer and we're (at office) enjoy using TIKI. Coding (plugins and some patches) for TIKI is my first PHP programming experience so any feedback welcome! 😊 I'm just try to write/fix some really needed and everyday used (at least by C++ programmers 😊) features and would like to hear opinion of TIKI developers....
