Phiki Wiki

</center>

When I went looking for a PHP-based **Wiki Wiki Web** several weeks ago, there were none so I set off to create one a WikiClone. When I got a reasonable version going and came back here to "register" it, I found two other PHP implementations already there. Sheesh.

Anyway, I based my code on [PikiPiki](#), a Python implementation of **Wiki Wiki Web** that I admire for its clean design. I have followed the formatting rules of [PikiPiki](#), although I'm thinking about converting to classic Wiki rules.

My biggest goal was to implement a **Wiki Wiki Web** that allows for very fast browsing. PHP seemed a good candidate since when run as an Apache module we can skip the whole fork/exec overhead thing. Although I'm fairly happy with the result, the algorithm I used to handle formatting chews up a lot of time. If only PHP3 had the '/e' option for regular expressions..

Oh yeah, you can find my code and an example PhikiWiki web via some links on <http://www.ontosys.com/reports/PHP.html> .
