

# PluginNoprint

Trying to hack a new `wikiplugin_noprint.php` in `lib/wiki-plugins` that helps wrapping text in order to not get that part of content printed in `tiki-print.php`:

Here's the try:

```
<?php

// No printing of content if the page is being printed
// Usage
// {NOPRINT()}
// data
// {NOPRINT}
function wikiplugin_noprint_help() {
    return tra("No printing of Plugin Content in the wiki page print mode");
}

function wikiplugin_noprint($data,$params) {
    global $tikilib;
    extract($params);
    {if $print_page !== 'y'}$data = trim($data);{/if}
    {if $print_page eq 'y'}$data = "";{/if}
    return $data;
}

?>
```

Any ideas on how to use Smarty code in Wikiplugins?

ML: very interesting. Let's make sure this works everywhere (articles, wiki pages, blog posts, etc) A PluginPrint would also be interesting.
