

SaaS

Tiki is easy to host. Just about any [hosting company](#) can offer PHP/MySQL hosting.

But what if you want a hosted version with 24/7 support? The hosting company supports the server, not the application.

This is a known weakness of Tiki as per [SWOT](#), and we are currently going over options to have (hopefully one day more than) one solution. This will be in parallel with [WikiSuite](#).

[Tiki8](#) has improvements in [dynamic preferences](#) and [System configuration](#) which will permit custom admin panels and make it possible for SaaS service providers to reduce the number of prefs (and thus potential support) available in a given Tiki instance. For example, they could deactivate all experimental features.
