

Site Layout

The flexibility of the layout and visual appearance of Tikiwiki is another one of the strengths of the software.

The basic layout of a tikiwiki site

{SPLIT()}

Turn it on, Move it around, Turn it off

Any of the sections (excluding the main content area) can be included or excluded according to what section of the site (wiki, articles, blogs, forums, html pages etc.) the user is visiting.

Content Modules can be easily shifted from side to side or put in any order you want.

Example: if you want to have a portal to the site without any boxes on the left or right side, you can remove these on the "html pages" section and then have the room and freedom to do anything you want (in html).

Hide it or Show it

Do you want to have certain modules visible to some groups and not others? Tiki does that. It can also completely change the look of your site from one area (wiki, blog, article) to the next.

Many, Many Modules

Within that basic architecture, smaller elements called Modules are inserted. Usually on a Tikiwiki site you will see a stack of modules on the left or right hand side. There are a whole bunch of standard modules that come with the standard tiki distribution, or you can create your own. These stacks are fully customizable by user group, and even by individual users - they can decide which of the allowed modules they want to see and where.

For example, you can have a couple of modules that have some tips for newbies, and these will only appear for anonymous users. When someone logs in the anonymous menus go away and menus for registered users appear.

Custom Menus

Modules are not menus, they are just boxes that menus or any other kind of content are dropped into. As always Tikiwiki configuration allows for the maximum flexibility, so it does include an interface that will help you create a customized menu for the site, and then you have to insert it into a module, and then you can assign the module to the site.
