

## Tiki Suite on Premise vs Cloud

Via [ClearOS](#), Tiki Suite has features for managing a local network (Firewall, VPN, printers, etc.). However, some organizations will want to avoid this and manage everything directly from hosted servers. Either because they don't have an office yet, or they want to get away from that. This is fine, in which case, they just ignore those features (and know that they are available if desired later on). ClearOS has plenty of features which make it very interesting even if you don't manage a local network.

Tiki Suite can be either:

- deployed on premises or
- deployed on your servers at the data center
- and we will encourage the emergence of a [Tiki Suite SaaS](#) ecosystem for "pay per user per month" type of offer.
