

TikiCluster

Building a Tikiwiki cluster

It's really easy. Get 2 (or more) machines that are well connected. I have 2 root-servers at server4free.de. Install tiki on both machines, but the mysql db only on one. Direct the mysql connection of the other machine to this one. In Admin->General, set to save the Session in the Database. Then create multiple A records for the Servername (e.g. redflo.de) with the different IP's in your DNS zone file.

Example:

```
redflo.de. 600 IN A 62.75.177.180
```

```
redflo.de. 600 IN A 217.172.183.33
```

We (ohertel and me) have set up a very fast 3-machines cluster: dupli.redflo.de. You can see in the "who is online" module how many people are on these 3 machines (london152, butan180 and florenz033).
