

TikiPageOutputFormat

Firstly we need to query PHP variable and check if the browser supported output is ok:

I suggest this gets added after the `include_once('lib/debug/debugger.php');` somewhere near the bottom of `tiki-setup.php`

```
if (strstr($_SERVER['HTTP_ACCEPT'], 'application/xhtml+xml')) {  
    header("Content-type: application/xhtml+xml");  
} else {  
    header("Content-type: text/html");  
}
```

Fingers crossed that should work.

Ive tested on a older 1.7 installation.
