

target:

- OS: ubuntu lts (16/04)
- http: apache2 + php7
- db: mysql5
- AD: windows-server 2008/12

required:

- permissions per groups on collections of resources (pages, images, attachments).
  - solved by use of categories + groups created as workspaces (per templates)
- ideally AGDLP application (role-based access control).
  - solved by permission inheritance from workspace-groups to AD groups
- AD integration
  - solved per LDAP setup

choice:

(because of restrictions originating from strict permissions requirement)

1. creating pages 1st, then assigning to cat.
  - pro: can edit text 1st, put link, follow empty link, create page.
  - contra: requires to assign category manually explicitly.
2. creating pages directly into cats via structures "Add Page" field/ button.
  - pro: automatically puts new page into cat / structure of page where you use the button.
  - contra: must prepend page-name with cat-name or else name misses cat part; can't use "pro" above.

To avoid accidental misplacement of pages to wrong cat permissions, we selected #2.

Either way requires dealing with global + cat permissions to setup in advance.

major issues:

- <https://dev.tiki.org/item6213> : editing cat permissions fails for names with "~" (namespace separator), e.g. "pe-hh~core" saves new permissions only as "pe-hh".
- <https://dev.tiki.org/item6215> : editing cat permissions titles the page only with the last part of a workspace ("pe-hh~core" -> "core"), not the whole path, can be confusing when you have 2 workspaces with the same name in 2 different templates (areas).
- <https://dev.tiki.org/item6214> : syntax highlighting works OK for all langs in editor, but produced / viewed pages only work with "php", all other langs are mono-colored.
- <https://dev.tiki.org/item5657> : must hack /lib/userslib.php to make group-sync work along Ticket #5657 => replace **all** occurrences.
- <https://dev.tiki.org/item6216> : workspace templates don't cover all possible permissions as globally possible.
- <https://dev.tiki.org/item6217> : need 2 permissions for "create structure" and "edit structure", so to provide structures that can be worked on but not messed up new ones or destroy them altogether.
- <https://dev.tiki.org/item6218> : workspace should create and assign file gallery, too, to keep files separated as pages.
- <https://dev.tiki.org/item6219> : copy&paste from media wiki this char "→" breaks "index rebuilding".
- <https://dev.tiki.org/item5036> : LDAP: clean-up up tiki group+user db when memberships change in AD (differential, not just incremental).
- <https://dev.tiki.org/item6220> : preview looks different from final output, like using "{CODE}..." creates

boxes, but used fronts differ.

- <https://dev.tiki.org/item6221> : renaming elements in cat OK for everything but perspective: cat listing still shows old perspective name while showing new wiki page names
  - "profile\_symbols" & "objects" tables not updated.
- <https://dev.tiki.org/item6222> : mediawiki importer fails because of "... =& new ...", in php7 the "&" is not allowed.
- <https://dev.tiki.org/item6223> : when renaming cat + homepage of workspace, the homepage property "Namespace" must be changed manually, too, otherwise new pages from the renamed page will be misnamed.
- <https://dev.tiki.org/item6224> : PDF/ office document files are supposed to be indexed while uploading, but indexing + upload fails.
  - "Incorrect string value: '\xFCr Spi...' for column 'search\_data' at row 1"
- <https://dev.tiki.org/item6277> : filling cells in sheets with too much content leaves it empty.
- rollback fails even though global + cat perms "tiki\_p\_rollback" is set.
- menu features require global permissions, although cat permission granted (structures, workspaces, search, tags, file gals).
  - cat permissions override global not only incrementally, but differentially: cat denies -> global doesn't apply.

minor issues:

- Links to forbidden pages should be indicated as such, not to be required to follow link just to learn afterwards that it's denied.
- renaming "perspective" because of cat name change doesn't allow/show new cat name and new homepage (to be) assigned.
- can't create Convene entries editable by groups.
- "list pages" shows only permitted pages, but indicates more not shown with empty results on pages numbered beyond reach.
- when setting up LDAP, LDAP config elements are invisible because "style=display:none;" when php-ldap is missing.
  - tiki-check.php just lists this case as "info", not as "bad/ ugly/ failure", which it is when selecting it in the auth method.
  - LDAP external groups hides the elements in the "user" section, but shows them in the "group" section. A hint for the missing php-ldap would be more useful than hiding.
- disable menu items when insufficient permissions (global yes, cat no).
- "remember login" fails.
- "featured links" module has no menu links, must enter URL in browser.
- when created page is removed from all cats a user has access to (by that user), user can't recover page.
  - not required to be solved, just info.

todo:

- doc: usecase
