

# UserPageStryker

Hello,

My name is Chris Austin and I'm currently employed as a Systems Architect/Programmer in Vancouver, Canada. I have been using linux for 10+ years at home and for the last 5 years at work. I code mostly in C, however, I have written a php/mysql on-line transaction browser and various other small php scripts.

I had been searching for a perfect php CMS for almost 2 years until I found the Tiki project. I've tried almost all of them and Tiki is by far the best! I have found Tiki well organized, nicely documented, has excellent features and the community is friendly.

I am in the process of introducing Tiki to my department and we will be going live very soon. Later on we will be developing some modules that will integrate into some of our backoffice systems.

In the meantime I want to dig in and start helping with development.

[Marc Laporte](#) has provided some ideas for me to think about :-

## Various

---

- [we need someone to work with Elliott on the Authena](#)
- module
- we have a timezone bug
- a
- table/spreadsheet plugin like jgraphpad but for spreadsheets
- [FOAF](#)
- Classified
- Shopping Cart module

## Distributed Authentication

---

- <http://tikiwiki.org/tiki-index.php?page=DistributedAuthenticationDev>
- <http://drupal.org/node/view/312>
- <http://groups.yahoo.com/group/php-universal/>
- <http://php.weblogs.com/universal>

## An IMAP client

---

## RFC links

- this one
- that one

# Thoughts/Ideas

- Should we attempt to port [IMP](#) or
- [SquirrelMail](#) or capitalize on current tiki
- WebMail POP3 code?
  - Dunno

# Modifications

- Created new file `imap.php`
- Added `imap_hostname`, `imap_port`, changed `pop,port`, in `tiki.sql`
- Added `account_type`, `imap stuff`, `pop variable rename` to `replace_webmail_accounts()` in `lib/webmail/webmaillib.php`
- Modified `templates/tiki-webmail.tpl` to add new `imaps` fields to form
- Modified `tiki-webmail.php` [settings](#) section to add new `imap` fields
