

I use Tiki for my site neonchart.com which is a site for technical analysis that shows [Fishnet Charts/Diagrams](#). It is now also possible to download the [logo](#) as a background picture. There exists backgrounds for 4:3 and 16:9 screens.

Work done in the tiki project

- The Swedish translation. The translation is not perfect, so do not heistate to contact me with comments or add them on page LanguageSwedish.
- Made (major) bugfixing of the script `get_strings.php` which is used for extracting strings to translate in the tiki project.
- Make spell checking easier when doing translations

Future tiki Project's

- Clean up/Structure CSS. [Sylvie](#) has the same thing on her agenda
- Struggle with UnusedWords.

Other tiki related work

For my own site i have made a module wich generates the menu with the share names and a normal page wich also shows the shares. Since the modules are quite specialized/specific i have not released them to the public.

I have also experimented with a context sensiteve module which shows different contents depending on which page it occurs in (e.g. shows top tiki-pages when viewing a Tiki page and top blogs when viewing a blog).
