
General Description

In almost all the text area boxes that you can edit within Tikiwiki, you can use WikiSyntax to improve the formatting (appearance) of your text and to create links to other Wiki and external Web pages. Consisting of special characters that you enter to mark formatted text, WikiSyntax is designed to be easy to use. It enables you to add formatting to your pages without having to learn or use HTML. For example, you can show bold text by typing two underscores before and after a word or phrase, as in the following example: example text. The result looks like this: **example text**. (In this context, the word *syntax* in WikiSyntax means "rules for how to type characters in the correct order.")

You don't have to memorize WikiSyntax. In Wiki pages, click Wiki Quick Help, one of the tabs attached to the editing area, to see a quick reference guide. Alternatively, click one of the QuickLinks (at the top of the Wiki editing area) to enter an example of the formatting syntax. The example appears at the bottom of the page you're editing.

You can use WikiSyntax in articles, blogs, comments, forums, HTML pages, and — of course — Wiki pages.

For more detailed information, see the following:

- [WikiCharacterFormattingDoc](#): bold, italic, underlining, colored text, and monospace (preformatted) text
- [WikiListDoc](#): bulleted, numbered, and definition lists
- [WikiTables](#): simple tables
- [WikiPageLayoutDoc](#): titles, headings, boxes, rules, centered text, and page breaks
- [WikiLinkingDoc](#): links to Wiki and Web pages

TIP: Also see [PluginList](#); several Wiki plugins provide advanced text formatting capabilities.

Quick Reference

The following is the same information you see when you click Wiki Quick Help while you're editing a Wiki page.

Text Formatting Rules:

Emphasis: `"` for italics, `_` for bold, `"_` for both

Lists: `*` for bullet lists, `#` for numbered lists, `;term:definition` for definition lists

Wiki References: `JoinCapitalizedWords` or use `((page))` or `((page|desc))` for wiki references
`))SomeName((` prevents referencing

External links: use square brackets for an external link: `[URL]` or `[URL|link_description]` or `[URL|description|nocache]` (that last form prevents the local Wiki from caching the page; please use that form for large pages!). For an external Wiki, use `ExternalWikiName:PageName` or `((External Wiki Name:Page Name))`

Multi-page pages: use `..<!--` this tag is broken inside of "np"; I've fixed this in HEAD. -- rlpowell, 24 May 2004 -->.page... to separate pages.

Misc: `!"`, `!!"`, `!!!"` make `_headings`, `----` makes a horizontal rule `"====text===="` underlines text

Title bar: `-=title=-` creates a title bar.

Wiki File Attachments: `{file name=file.ext desc="description text" page="wiki page name" showdesc=1}` Creates a link to the named file. If page is not given, the file must be attached to the current page. If desc is not given, the file name is used for the link text, unless showdesc is used, which makes the file description be used for the link text.

Futhermore any HTML numeric character entities can be input as "~nnn~" which give "&#nnn;" where 'nnn' is the numeric value of the character

In addition, here is a guide to the plug-in syntax, which is displayed when you click **Show Plugins Help** in the **Wiki quick help** screen. More information on plug-ins is available: PluginsList.

Note that plugin arguments can be closed in double quotes (""); this allows them to contain , or = or >.

AVATAR	Displays the user Avatar
BOX	Insert theme styled box on wiki page
CATEGORY	Insert list of items for the current/given category into wiki page
CATORPHANS	Display Tiki objects that have not been categorized
CATPATH	Insert the full category path for each category that this wiki page belongs to
CENTER	Centers the plugin content in the wiki page
CODE	Displays a snippet of code. Set optional paramater ln to 1 if you need line numbering feature.
COPYRIGHT	Insert copyright notices
DL	No description available
EXAMPLE	No description available
FANCYTABLE	Displays the data using the TikiWiki? odd/even table style
GAUGE	Displays a graphical GAUGE
MODULE	Displays a module inlined in page
MONO	Displays the data using a monospace font
SORT	Sorts the plugin content in the wiki page
SPLIT	No description available
SQL	No description available
WIKIGRAPH	Renders a graph

Todo

Check if all these are on the wiki pages and in tiki-edit_help.tpl:

## Key Function and sub-features

---

### Related Links

---

### Typical Uses

setting up an external wiki link will allow you to link directly to the wiki page with a wiki tag.

For example: `thinking` will link to Wikipedia to the thinking page.

dgd I'm having a blast with linking to wikipedia

dgd though this does not work [[wp:thinking|thought]]

dgd this doesn't work as expected either

dgd `thought`

dgd will produce thinking as the link and not thought

dgd this does't work either

dgd `wp:thinking`

see also ExternalWiki
