

Tiki 17.0 released

Gary Cunningham-Lee - 28 Jul 2017 17:00 GMT-0000

The Tiki Community is pleased to announce the latest stable release - Tiki 17.0 aka Zeta Boötis. This update includes many new features and code improvements, as well as security fixes. Get Tiki 17.0 at the [download page](#).

Tiki 17, originally scheduled for an April 2017 release but pushed back for extra fixes and enhancements, brings a number of significant new features including support for modern favicons, password blacklists, and a new method for annotations.

New external libraries integrated as features include H5P, the open source platform for creating, sharing, and reusing interactive HTML5 content; and CasperJS, a browser navigation scripting and testing utility written in JavaScript for PhantomJS or SlimerJS. (Correction: A previous version of this article stated that Exposé IDS (intrusion detection system) is a new feature in Tiki 17. This feature will debut in Tiki 18. Sorry about any confusion.)

Feature advancements include a massive improvement in PDF generation via mPDF, tracker additions and enhancements including a more versatile user selector field type, typography enhancements based on PHP SmartyPants, and a number of new wiki plugins.

For the most polished and feature-complete Tiki Wiki CMS Groupware experience, an upgrade to Tiki 17.0 or new installation as a first Tiki website is highly recommended!
