

Tiki 26 Release Continues Rapid Feature Development

Gary Cunningham-Lee - 30 Jul 2023 15:29 GMT-0000

Following the project's biggest-ever release, Tiki 25, seven months ago, the pace of code commits has only accelerated and now Tiki 26 is available with significant new features, further development of recent feature additions, and the usual bug fixes and enhancements.

New features include color mode support, so Tiki sites are responsive to the user's browser color scheme preference and can be toggled between light, dark, and auto (with more configurability options coming soon). A new emoji picker enables picking and inserting emojis (finally 🗨️). Tiki 26 includes a new theme, BookStacked, an implementation of the BookStack web app appearance. Interact.js and a URL fragment guesser have also been added.

Enhancements have been made to Cypht webmail, Calendars, the debugger console, InterTiki (for inter-Tiki-website interaction), Manticore search, Tiki's Markdown implementation, several modules, Tablesorter, Tiki Crawl for web scraping and web crawling, and the tracker feature. See <https://doc.tiki.org/Tiki26> for more details.

Tiki 26 has been updated to benefit from the higher performance and new features of PHP 8.1. See [Requirements](#) for more information about Tiki and PHP versions.

This release is available for download or installation via [git](#) or [Tiki Manager](#).

Many thanks to all who contributed to developing and testing Tiki 26.

Tiki is free Open Source software that is made possible by individual volunteer efforts and donated funds and services. If you would like to help the project continue, please visit the page [Contribute to Tiki](#). Any donation would be greatly appreciated.

If there are any questions about this new release, please ask in the [Tiki community chat room](#) or use other contact options. To look into paid assistance, please visit the [consultants page](#). For enterprise-level support, please contact [EvoluData](#).
