

This is a module to show the last posted articles.

The module is called `last_articles` and has the usual parameters

- `nonums`
- `rows`
- `type` - optional string value to filter down to all articles of a specific type
- `topic` - optional string value to filter down to all articles of a specific topic
- `topicId` - optional numeric value to filter down to all articles of a specific topicId
- `categoryId` - optionnal category ID (tw >= 1.9.8)
- `lang` - optional language(ex:en) (tw >= 1.9.8)

For type, topic and topicId you can inverse the search (to get all articles excluding the specified ones), just prepend a ! to the name or number of the type/topic/topicId.

Display latest articles of type Event and Review:

```
{MODULE(module=>last_articles,type=>Event+Review)}{MODULE}
```

Display latest articles that do NOT have the topicId 3, 4 and 8 (the ! in front negates the definition):

```
{MODULE(module=>last_articles,topicId=>!3+4+8)}{MODULE}
```

These optional parameters can be used together, too:

{MODULE(module=>last_articles,type=>Article,topicId=>5+8)} {MODULE}
))TikiTeam()
