

# Vision

Use Tikiwiki directly from the Desktop, not via Browser interface / Cross-Platform as usual/

This is just a Tiki Desktop extension idea:

## Implementation:

- when designing new tikicore we should take into consideration complete desktop integration with php-gtk or similar later on...
- reuse php codebase and create smarty hooks for php-gtk... we only need to hack some tiki templates...
- in about a year or so with gtk2 and php5 support, php-gtk is going to be a good cross-platform interface for nix and windows...

# Inter-Facing

- Maybe GalaxiaWorkflow benefits most...

# Some technical details

- As far as I see it, php-gtk is best used for local sql connections.
- So, lets tunnel mysql port through ssh to get local connections anywhere...

# Links to dig in:

# The world is so small:

Andrei Zmievski is a man of many talents. Although he is best known for his contributions to the PHP-GTK and Smarty Template Engine projects, his interests range as far afield as history and linguistics. The PHP community is lucky to have kept his attention for this long!
