

Insert a link with a tooltip onto a wiki page.

This plugin uses the OverLib? feature already in Tiki that gives us the user info popups.

This is an alternative to **PluginTOOLTIP** – this one accepts the = sign in the URL.

In this version you put the URL for the link in between the tags like this:

```
{TT(linktxt=CLICK HERE, target=blank, msg=This is a Tooltip!)}tiki-index_raw.php?page=test{TT}
```

Please let me know which you like better, PluginTT or PluginTOOLTIP.

--Colorado

Does anyone know how to code wiki plugins to accept the = sign in the plugin parameters?
