The ring of tikiwiki community website

see also TikiServersNetwork

How does this work ?

This web ring is manual for now, I hope we'll integrate an automatic webring feature in tikiwiki soon. The tools for the ring are :

- a custom menu holding the urls of all the websites in the ring
- a set of rss url for available syndication
- a tikiwiki.org two-letters subdomain optionnaly, for localized dedicated tikiwiki, or any subdomain depending the topic of te tikiwiki website
- release flow of sql script for website maintainers to update their custom menu and rss feeds at weekly rate (tikiring script will be a separate php simple script to be compatible with any tikiwiki version from 1.6).

Requirement for tikiwiki website to be part of the ring

- behave compliantly with community environment (very tricky way to declare that there is no prior rule, only afterwards moderation of anything if anything has to be dealt with).
- enable phplayers for display of the usermenu is optional, as the menu can be displayed with any shape
- being able to manage a virtualhost and keep admin at tw.o informed of any change if you use a tikiwiki.org subdomain
- have a server on a static IP with honest bandwidth (dsl home servers are tolerated though, but we know it's not a very reliable way to provide a service on a long term).
- setup a tikiwiki minimal version 1.7.5 and manage it like you want.

List of tikiwiki community websites in the ring

- http://tikiwiki.org
  - international (bad) english spoken, the main community website (some other languages are used here eratically).
  - hosting forums, wiki largest development cloud, directory links, FAQs and actually many other things that will tend to a spliting in other websites for load sharing (imagegal and filegals go to uk.tw.o, thx damian !
